# Introduction/Background

## Healthcare needs

Health inequity and health care barriers

## Q&A systems

Break down barriers like limited health literacy and language

## Objective

Build a multimodal and multilingual medical QA system to process speech, text, and medical images to democratize information

## Purpose

Empower patients by providing more accessible and personalized medical information

# Datasets

PubmedQA - expert labeled answers to 1000 queries

| <b>pubid</b><br>int32 | <b>question</b><br>string                       | <b>context</b><br>sequence                                | <b>long_answer</b><br>string              | <b>final_decision</b><br>string |

# Datasets

MIMIC-IV-Note: Deidentified free-text clinical notes

Radiology reports (2.3M)  
from 237K patients

Discharge summaries (331K)  
from 145K patients

# Vector Embedding Models

We researched two different types of Embedding models

BiomedNLP-BiomedBERT-base  
(110M params) by Microsoft

Context window: 512 tokens

Trained on abstracts and full-texts  
from PubMed and PubMed Central

"Text-embedding-ada-002"  
by OpenAI

Context window: 8192 tokens

Trained on Internet perhaps?

# Knowledge-base preparation

Long discharge summaries are condensed into shorter summaries

3K (from 331K) discharge summaries

Average length ~ 10K characters per note

GPT-4o-mini

3K (from 331K) shortened discharge summaries

Average length ~ 700 characters per note

# Knowledge-base preparation

3K shortened  
discharge  
summaries

Avg chars ~ 700

BiomedBERT model

Used for text-based  
retrieval

768 dimensional  
vector embeddings

50K (out of 2.3M)  
Radiology reports

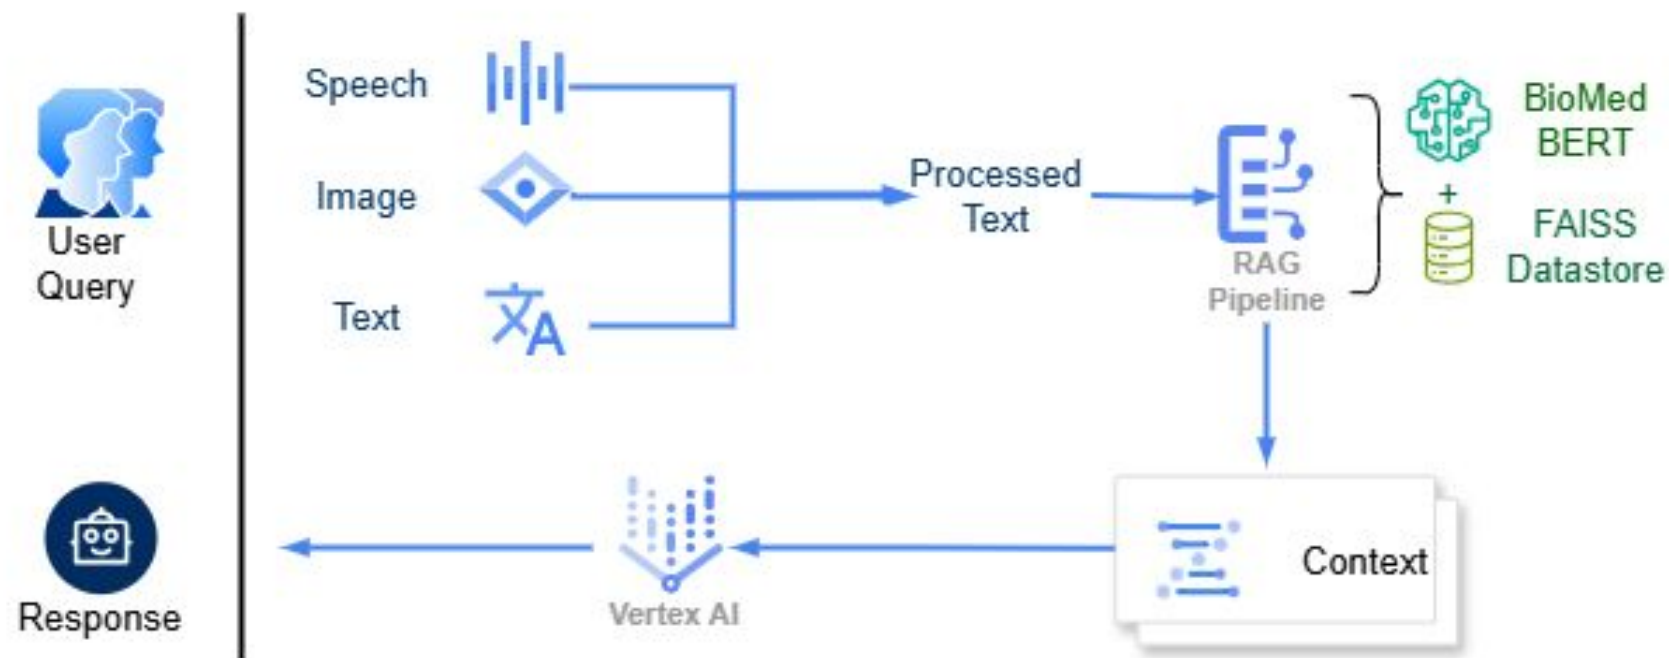

Avg chars ~ 1K  
per report

Used for image-based  
retrieval

## Architecture: MedAid

# Prompt Structure

---

""""

Based on the following information, provide a clear and accurate response to the last question in the conversation.

{preliminary\_findings (if image is present)}

{medical\_history\_section}

{retrieved\_contexts\_section}

Conversation History:

user: query 1

assistant: Response 1

user: query 2

""""

# Results (RAG-based responses)

| PubMedQA Dataset<br>(expert labeled) | PubMedBERT embeddings | OpenAI embeddings |

LLM: Gemini-1.5-flash

Temperature 0.1

Number of retrievals(K) = 5

# MedAId Demo: X-ray image and speech

---

# MedAId Multimodal Example: MRI

Ground truth diagnosis:  
Glioblastoma  
(subtype of Gliomas)

The axial T2-weighted MRI shows a posterior fossa mass, likely a cerebellar lesion.

What abnormalities do you see in this brain MRI?

What are the potential diagnoses based on these findings?

Potential diagnoses include:  
Meningioma  
Metastatic tumor  
**Gliomas**  
Hemangioblastoma  
Ependymoma  
Abscess

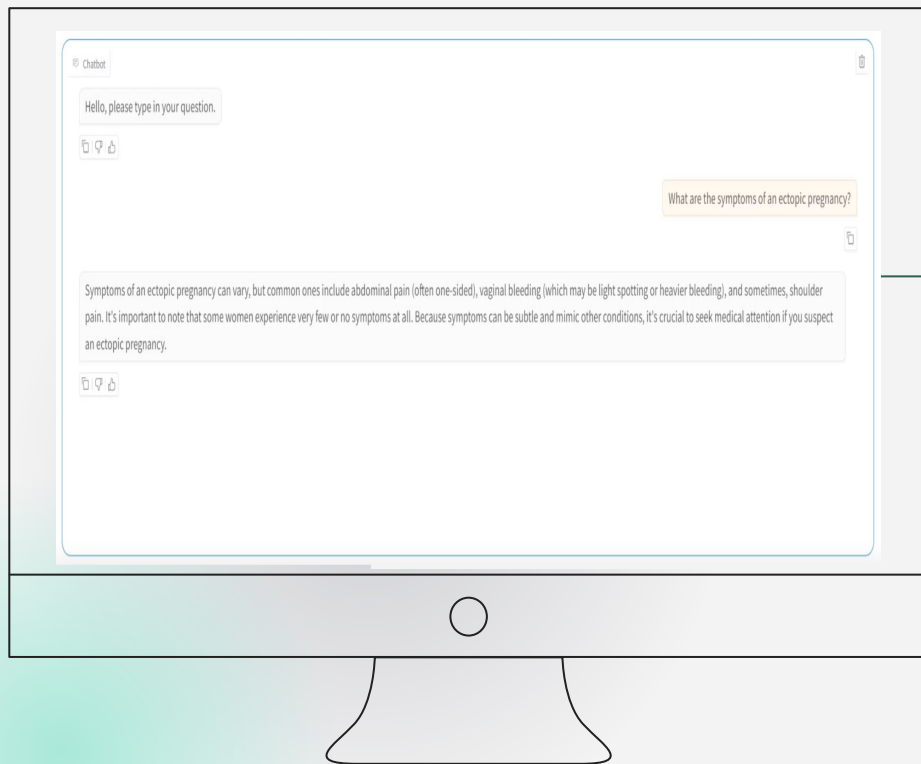

# MedAId Demo: multilingual

---

# Grading: metrics

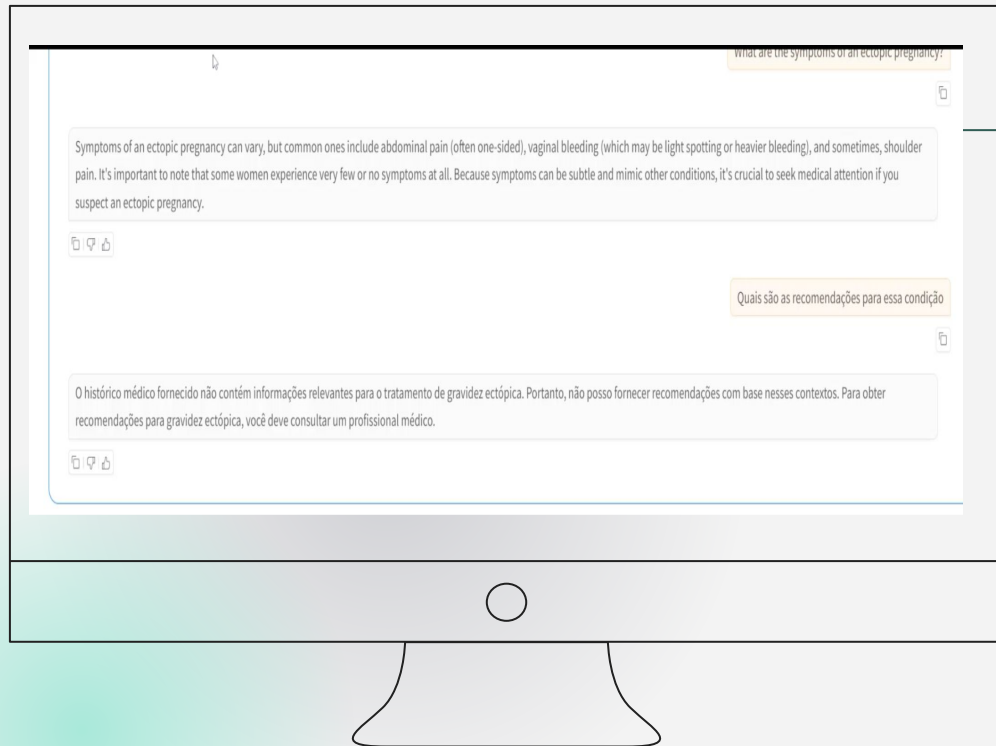

## Results: Grading(EN)

|                         |             |
|-------------------------|-------------|
| Medical professional 1: | <b>9</b>    |
| Medical professional 2: | <b>9.12</b> |
| Medical professional 3: | <b>8.75</b> |
| LLM:                    | <b>9.25</b> |

## Results: Grading(PT)

|                         |            |
|-------------------------|------------|
| Medical professional 1: | <b>8</b>   |
| Medical professional 2: | <b>7.5</b> |
| Medical professional 3: | <b>7.2</b> |
| LLM:                    | <b>8.5</b> |

# Discussion

By integrating multimodal and multilingual inputs and addressing accessibility barriers, this system demonstrates the potential to enhance both patient outcomes and clinical efficiency

## Strengths

- Multimodal capabilities (text, speech, images) enhance flexibility and usability
- Bridges accessibility gaps for linguistically diverse groups
- Supports patients with tailored, context-rich responses

## Limitations

- Budget constraints
- Compute constraints

# Future Work

1. **Enhanced Embeddings:** Leverage advanced embeddings like OpenAI embeddings for improved performance and relevance.
2. **Vision-Language Models (VLMs):** Incorporate medical imaging-specific VLMs (e.g., LlavaMed) for superior preliminary findings and retrieval accuracy.
3. **Comprehensive Use of MIMIC-IV:** Utilize the full potential of MIMIC-IV with extended context capabilities offered by OpenAI embeddings.
4. **Expanded Knowledge Base:** Augment the MIMIC-IV dataset with additional high-quality datasets to enhance model understanding.
5. **User Experience Enhancement:** Focus on refining the interface for a more intuitive and seamless user interaction.

---

# Summary/ Conclusion

---

Our multimodal and multilingual QA system represents a significant step toward improving healthcare accessibility and decision-making by combining speech, text, and medical imaging into an intuitive and reliable tool
